

RAGGER

The RAGGER is a typical auxiliary machine for continuous pulpers and is used for the removal of flexible and thread-shape contaminants (plastic bags, ropes, rags, wires) normally contained in waste paper bales. It can be combined with other machines (Rotating screen, Turbowasher, Rope cutter) for a complete cleaning system of low density pulpers. The RAGGER is specially designed to work in hard conditions and can be equipped with a control panel for working cycle control.
